PP2 COMMENTS & ACTIONS TAKEN

Student Name	Comments	Actions Taken
I W O Indudunu		
S A A M Amaradasa		
P K S Fernando	Need a clear understanding of how many video frames are being split and processed. The number of frames should be configured based on the video duration, because if important frames are missed, the violation may not be detected accurately. A better understanding of the overall component is required, and the output should be presented in a more user-friendly manner.	I improved the system by implementing dynamic frame extraction based on video duration, instead of using a fixed number of frames. This ensures important frames are not missed and improves detection accuracy. I also enhanced the output to be more user-friendly, with structured results and timestamps for easier understanding.

SafeLink : AI-Powered Mobile Platform Enhancing Public Safety and Community Policing in Sri Lanka

Problem in Brief

- Public safety systems are slow and reactive, relying mainly on hotline calls and manual reporting.
- Existing solutions focus on single domains (traffic, social media, or emergency) without integration.
- Lack of real-time situational awareness due to absence of live video, audio, and location data.
- Limited use of AI and predictive analysis to prevent incidents before they occur.
- Poor coordination between citizens and authorities, leading to delayed response and inefficiency.

Design Excellence of Overall Solution

- Integrated AI platform combining SOS, traffic monitoring, social media detection, and safety prediction
- Real-time multimodal analysis using video (YOLO) and text (BERT)
- Live SOS system with GPS tracking, video/audio streaming, and instant alert generation
- Predictive risk analysis to identify high-risk areas and support proactive decision-making
- Centralized police dashboard with live tracking, severity scoring, and incident monitoring
- Bilingual support for better accessibility in Sri Lanka
- A fast and intelligent response system improves communication between users and authorities

EMERGENCY SOS WITH REAL-TIME LOCATION & LIVE STREAMING

Specialization : Information Technology

Emergency SOS with Real-Time Location & Live Streaming

- Emergency reporting mainly depends on voice calls (119).
- Victims may be scared, injured, or unable to speak clearly.
- Police cannot understand how serious the emergency is.
- This leads to delayed response and unsafe outcomes.

AI-POWERED WOMEN AND CHILDREN SAFETY RISK PREDICTION SYSTEM

Specialization : Information Technology

Emergency AI-Powered Women and Children Safety Risk Prediction System

Research Problem

- Women and children face daily safety threats.
- Detect emergencies but lack predictive safety insights.
- No reliable Sri Lanka-focused solution.
- Sinhala language support is missing.

IT22329660 | FERNANDO P K S

REAL-TIME AI SYSTEM FOR DETECTING HARMFUL SOCIAL MEDIA CONTENT

- The harmful social media content detection feature is designed to monitor and analyze social media content to identify harmful activities .It uses AI techniques to process text, images, and audio, and presents the detection results in real time through a dashboard.

SMART TRAFFIC VIOLATION DETECTION & ACCIDENT PREDICTION SYSTEM

Specialization : Information Technology

Smart Traffic Violation Detection & Accident Prediction System

- Road accidents remain a major cause of deaths in Sri Lanka.
- Current enforcement methods.
- Limitations of current systems.
- Existing systems focus only on single tasks.
- No integrated framework for real-time detection and prediction

Thank You!
